Mississauga, ON | Open to Relocate

Professional Summary

Cloud, DevOps, and SRE engineer with hands-on experience across AWS and Azure monitoring, incident response, CI/CD pipelines, and infrastructure automation using Terraform, Kubernetes, and GitHub Actions. Built and load-tested an autoscaling LLM serving platform on AWS EKS, shipped a cloud-native web application from local development to Azure production, and resolved live infrastructure failures end to end. AZ-104, Terraform Associate, AWS Certified Cloud Practitioner, and AWS Certified AI Practitioner certified.

Technical Skills

Cloud Platforms: AWS (EKS, EC2, ECR, VPC, S3, IAM, CloudWatch), Microsoft Azure (Entra ID, RBAC, Azure DevOps, Networking, Defender), GCP (fundamentals); cloud infrastructure support, reliability operations, and scalable resource provisioning

Infrastructure as Code: Terraform (HashiCorp Certified), Ansible; automated provisioning, configuration management, environment consistency, cost efficiency, and infrastructure change implementation

CI/CD & Automation: GitHub Actions, Azure DevOps, Jenkins, GitLab CI, ArgoCD; pipeline maintenance, deployment support, build troubleshooting, and workflow automation

Containers & Orchestration: Docker, Kubernetes, Helm, Horizontal Pod Autoscaler (HPA); containerized workload support, deployment troubleshooting, resource management, autoscaling, and cluster operations

Observability & Monitoring: Prometheus, Grafana, Splunk, ELK Stack, Dynatrace, CloudWatch, k6 load testing; alert configuration, threshold tuning, dashboard creation, incident detection, log analysis, and SLA-driven response

Incident Response & Documentation: Alert triage, escalation procedures, root cause analysis, postmortem documentation, runbook maintenance, knowledge base contribution; SLA awareness

System Administration & Networking: Linux/Ubuntu (primary), Windows Server; TCP/IP, DNS, HTTP(S), SSL, VPN, firewall configuration; system debugging, patching, and connectivity incident resolution

Scripting & APIs: Python (primary), Bash, PowerShell; REST API integration, operational automation tooling, web application performance scripting, and workflow efficiency improvements

Education

Lambton College — Mississauga, ON
Postgraduate Diploma – Modern Networks & Cloud Computing — *January 2024 – August 2025*

Gudlavalleru Engineering College — India
Bachelor of Technology – Electronics & Communications Engineering — *September 2019 – April 2023*

Professional Experience & Projects

Cloud & DevOps Engineer — May 2025 – August 2025
Blue Current Technologies (Lambton College WIL Project) — *Mississauga, ON*

- Improved system reliability and reduced mean time to detection by configuring Prometheus alert thresholds and building Grafana dashboards that surfaced degradation signals across AWS and Azure environments before they breached SLA targets.
- Accelerated incident resolution by triaging production alerts across infrastructure and API layers, escalating to senior engineers with structured context, and adding root cause findings to the team knowledge base to reduce repeat escalations.
- Improved developer experience and deployment pipeline stability by diagnosing and restoring failing GitHub Actions and Azure DevOps workflows, reducing deployment downtime and enabling engineering teams to ship with greater confidence.
- Reduced infrastructure provisioning time and improved environment consistency by automating cloud resource deployment using Terraform and Ansible, eliminating manual setup across AWS and Azure and cutting per-environment configuration errors.
- Kept infrastructure costs within budget and maintained platform scalability by right-sizing cloud resources across AWS and Azure, identifying over-provisioned instances during operational reviews and reallocating capacity without service disruption.
- Reduced operational complexity and eliminated recurring incidents by refactoring runbooks, closing documentation gaps across five infrastructure components, and resolving the root causes of repeat alerts rather than re-escalating them.

Platform Engineering Lead – Hybrid Cloud Banking SaaS January 2025 – April 2025

Lambton College Capstone *Mississauga, ON*

- Improved system observability across a hybrid cloud SaaS banking platform by building Prometheus and Grafana dashboards that tracked API response times, service health, and error rates, enabling the team to detect and respond to incidents before user impact.
- Reduced incident resolution time by coordinating response across engineering and security workstreams, engaging relevant teams immediately upon alert, and producing structured postmortem reports that captured root cause and prevented recurrence.
- Improved deployment reliability and developer experience by maintaining CI/CD pipelines in GitHub Actions and Azure DevOps, implementing structured infrastructure changes, and keeping all changes documented to ensure continuous and auditable platform delivery.
- Hardened platform security and improved Kubernetes cluster scalability by auditing IAM and RBAC configurations across AWS and Azure, removing 30+ excessive permissions, and aligning access controls to least-privilege compliance requirements.
- Reduced technical debt and operational complexity by auditing infrastructure configurations, identifying redundant and misaligned resources, and refactoring Terraform modules to improve consistency and cost efficiency across the platform.

Project: LLM Serving Platform on AWS EKS – Autoscaled Model Serving October 2026

github.com/dev-95/llm-serving-eks

- Provisioned an AWS EKS platform (VPC, managed node group, ECR) with Terraform and deployed a CPU-based llama.cpp LLM server (Qwen2.5-1.5B) through a Helm chart, running a non-root, read-only-filesystem container from an immutable-tag registry, then destroyed all 46 resources and verified a clean teardown.
- Validated autoscaling with a 10-minute in-cluster k6 load test in which the HPA scaled the service from 1 to 3 pods across 3 nodes, served 202 requests with zero failures, and peaked at 29.4 tokens/sec cluster-wide (p95 latency 25.13s on CPU-only inference).
- Improved observability by deploying kube-prometheus-stack with a ServiceMonitor and a Grafana dashboard tracking tokens/sec, queued requests, pod count, CPU, and memory, and resolved a Free plan instance-type block found through CloudTrail by switching to an eligible instance family.

Project: Multi-Market ETF Tracker – Cloud-Native SRE Showcase January 2026 – March 2026

github.com/dev-95/Multi-Market-ETF-Tracker-Cloud-Native-DevOps-Showcase

- Shipped a production-grade cloud-native web application to Azure App Services using Terraform IaC, provisioning the full stack (resource group, VNet, Linux web app, Docker registry) in a single automated run while staying within free-tier cost constraints.
- Restored deployment reliability after two infrastructure failures, a regional quota exhaustion requiring full stack migration and a Docker registry path conflict in Azure, by isolating root causes and applying targeted Terraform configuration fixes, bringing the service back to operational state without data loss.
- Improved release confidence and observability by building a GitHub Actions pipeline in which an eight-test pytest suite gates every Docker image build, and by adding a Prometheus and Grafana stack with Telegram alerting on failed data fetches, alongside Azure Portal Log Stream monitoring to validate deployment health.

Additional Experience

Cybersecurity Virtual Internship October 2022 – December 2022

AICTE (All India Council for Technical Education)

- Reduced mean time to respond to security alerts by configuring IDS rules, tuning firewall policies, and building an incident SOP that cut response steps from ad hoc to structured, measured by a 25% improvement in security posture assessment scores.
- Reduced operational complexity and accelerated future incident response by documenting security incidents, resolution steps, and SOPs that served as the team's reference for recurring alert patterns.

Virtual Internship – Machine Learning & Application Development February 2022 – April 2022

SmartBridge (IBM Watson Partner)

- Cut API processing latency by 15% on a cloud-hosted IBM Watson web application by profiling bottlenecks, identifying redundant preprocessing steps, and rewriting the offending Python functions, a first solo optimization shipped to a live service.
- Improved team knowledge sharing and developer experience by collaborating with senior engineers to document complex technical resolutions, contributing to a shared knowledge base that reduced future debugging time.

Certifications & Training

Microsoft Certified: Azure Administrator Associate (AZ-104)

HashiCorp Certified: Terraform Associate (004)

AWS Certified Cloud Practitioner

AWS Certified AI Practitioner

Microsoft Certified: Azure Fundamentals (AZ-900)
